

MEDICAL MICRONEEDLING

BEST ALL ROUND TREATMENT

here's why

There are 4 main factors that should be addressed by skincare products and treatments:

1. Hydration
2. Texture
3. Quality
4. Tone

HYDRATION

✘ Skin too dry or too oily

TEXTURE

✔ Smooth and Soft

✘ Rough and scaly

QUALITY

✔ Firm and plump

✘ Wrinkles and sagging

TONE

✔ Uniform Complexion

✘ Uneven skin tone

What is Microneedling

Microneedling uses tiny needles to puncture the epidermis without destroying any part of the skin

The process of needles puncturing the skin triggers wound healing, including **collagen production**

Collagen keeps skin **firm and wrinkle-free**. Increasing collagen improves texture and quality.

The process also **increases blood circulation** in the skin that is necessary for skin cells to receive more oxygen and nutrients

The tiny skin punctures create micro-channels for active ingredients in **serums to enter** deep into the skin. This can improve hydration and tone.

medical & aesthetics

How the procedure works

The skin is cleaned and numbed with a cream. An automated device, called an Innopen, is used. The needles are repeatedly stamped across the skin so the needles penetrate evenly. The depth and speed of needle penetration can be controlled. You shouldn't feel much. Your skin will be red immediately after the treatment and may be sensitive for a few hours.

Conditions that can be treated

- Acne Scarring
- Post-inflammatory hyperpigmentation
- Melasma
- Sun spots
- Fine lines & wrinkles
- Surgical / other Scars
- Stretch Marks
- Hair Loss

Duration: 60 minutes

Downtime: 1 - 3 days

Cost: R2000

Current August special:

Complimentary Peptide Aqua Gel

Mask with your treatment

Innopen is a state-of-the-art device

Innopen is manufactured in and imported from the USA.

The device has a **specially designed tip** containing high quality, sterile needles.

A different tip is used at every session for every patient. This is a safety precaution which reduces the risk of infection.

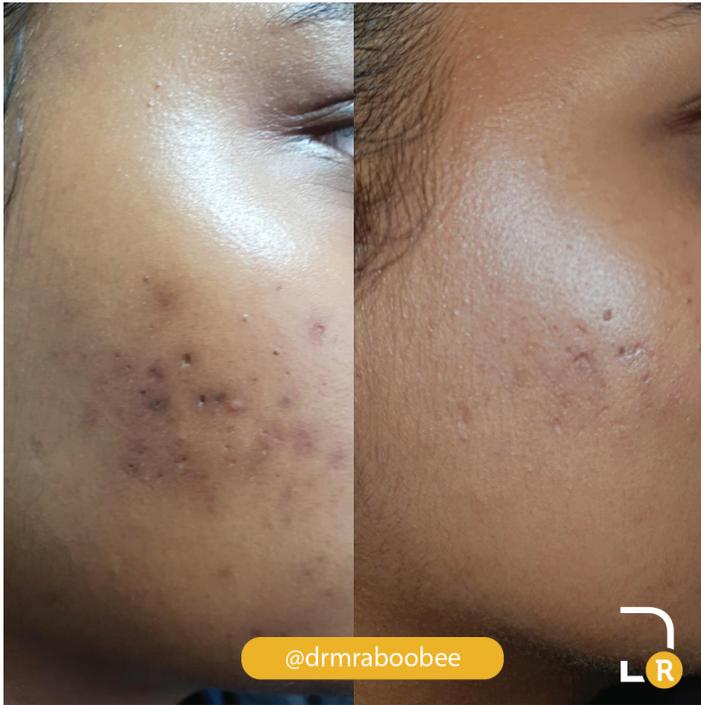

The tip has 3 safety features

1. **Prevents backflow** of blood into the device

2. Flat contact surface means **needles penetrate skin evenly**, with all needles penetrating the skin at the same depth at any given time

3. If a needle is damaged during the treatment, that needle will remain within the cartridge and will not reach the skin **reducing surface trauma**

Before and After

Microneedling

The number of sessions you will require depends of the severity of the condition/s being treated and can vary from patient to patient.

On average, 4 sessions 4 weeks apart are usually needed to see improvements in tone, quality, hydration and texture.

Microneedling & PRP

Microneedling can be done using Platelet-Rich Plasma (PRP). This plasma is derived from your blood and used in place of a serum during your treatment.

PRP increases growth factors at the site and aids in producing more collagen.

Benefit: Smoother, hydrated, youthful looking skin
